PROFESSIONAL SUMMARY

Flutter Developer with 1+ year of hands-on Flutter and Dart experience shipping cross-platform apps for Android and iOS. Currently building La Tansa for a freelance client: a 13-language reminders and prayer-times app with native Kotlin/SwiftUI home-screen widgets and alarm-grade notifications, delivered to iOS through a Codemagic → TestFlight pipeline and backed by 2,534 automated tests. Built MedCare, a full-stack healthcare platform with a two-role Flutter client and a self-built Node.js/TypeScript backend on PostgreSQL, deployed to production. Converts Figma and Stitch designs into pixel-perfect Flutter UI and integrates REST APIs with Dio, Retrofit and JWT token refresh, using Provider and BLoC/Cubit within Clean Architecture and MVVM. Maintains a live Google Play app across multiple releases, and works independently or in teams through Git/GitHub pull requests in a fully remote workflow.

TECHNICAL SKILLS

Flutter & Dart: Flutter, Dart (Null Safety), Cross-Platform Development (Android & iOS), Responsive UI, Custom Widgets, Animations (Lottie), Skeleton Loading, Accessibility (Semantics, reduce-motion), Dark/Light Theming, Localization & RTL (13 languages incl. Arabic, ARB/gen-l10n), GoRouter (StatefulShellRoute, auth guards), Arabic Speech Recognition, Real-Time Audio & Microphone Session Handling

State Management: Provider, BLoC/Cubit, Selector, Dependency Injection (GetIt, Injectable)

UI Implementation: Figma to Flutter UI (pixel-perfect), Stitch UI/UX Handoff, Design Systems (color, typography & spacing tokens), Material Design, Reusable Component Libraries

API Integration: REST APIs, Dio, http, Retrofit, JSON Serialization, Bearer/JWT Authentication with Token Refresh, Cursor Pagination, Idempotency Keys, Error Mapping & Exception Handling, Postman

Firebase: Firebase Authentication, Cloud Firestore, Google Sign-In, Sign in with Apple, Real-Time Data Synchronization

Payments: Stripe integration (Payment Intents, native Payment Sheet, webhook signature verification), PCI-compliant client-side tokenization, 3D Secure handling

Backend: Node.js, TypeScript, JavaScript, Express, PostgreSQL with Prisma, MongoDB with Mongoose, MySQL, Redis (Upstash: caching, rate limiting, idempotency), REST API design, Zod validation, Keyset Pagination, JWT with refresh-token rotation, 2-step verification (email OTP), bcrypt/argon2, Access Control, Multer file uploads, Nodemailer/Mailjet, Postman

Architecture & Patterns: Clean Architecture, MVVM, Repository Pattern, Use Cases, SOLID Principles, Design Patterns, Multi-Environment Builds (mock/dev/staging/prod)

Deployment: Google Play Console Publishing, Release Builds (AAB/APK), Versioned App Updates, Post-Launch Maintenance, Codemagic (iOS CI/CD from Windows), TestFlight, App Store Connect API Keys, iOS Code Signing (certificates, provisioning profiles), Physical Device Testing

Native & Platform: Home-Screen Widgets (Kotlin AppWidgetProvider/RemoteViews, iOS WidgetKit/SwiftUI, lock-screen), App Groups, Deep Links, Xcode Project Configuration

Performance & Storage: App Performance Optimization, Debugging & Bug Fixing, Background Services, Local Notifications (flutter_local_notifications, exact alarms, alarm-volume channels, DND bypass, iOS time-sensitive alerts, custom sounds), Offline-First Data (SQLite/sqflite, Hive, SharedPreferences), Secure Storage (flutter_secure_storage), zlib Compression

Version Control & Testing: Git, GitHub, Feature-Branch Workflow, Pull Requests, Code Review, Merge Conflict Resolution, GitHub Actions (CI/CD), Codecov, flutter_test, Mocktail, bloc_test, Live-API Integration Tests, Agile & Remote Collaboration, Android Studio, VS Code

EXPERIENCE

Freelance Flutter Developer — La Tansa (لا تنسى), Client Project (Remote)

October 2026 – Present | Android APK and iOS TestFlight builds delivered to the client

- Building a personal memory and reminders app (notes, voice, documents, search, reminders, prayer times) in 18 stages, each gated by analyze and the full test suite; Clean Architecture + MVVM with Cubit, injectable DI, GoRouter and 4 environments.
- Shipped iOS builds from Windows through a Codemagic pipeline to TestFlight, with App Store Connect API signing and automatic profiles for the app and widget extension; resolved App Store warnings and fixed device-only bugs found on a physical iPhone.
- Built native home-screen widgets (Kotlin AppWidgetProvider, iOS WidgetKit/SwiftUI) that share data through App Group snapshots and open screens via deep links, plus on-device prayer times with Adhan alerts (Android exact alarms, iOS time-sensitive notifications) and alarm-style reminder ringtones.
- Implemented Google, Apple and email sign-in, optional phone linking with OTP, and active-device management; localized into 13 languages (Arabic RTL), backed by 2,534 automated tests run in every language at large text sizes.

Mobile App Development Intern — Uneeq Interns (Remote)

May 2026 | Best Intern of the Month, App Development Track

- Delivered two production Flutter apps (QuizMaster, AI To-Do) from concept to release, converting a documented requirements spec and supervisor-provided Stitch UI designs into working features.
- Integrated Firebase (Auth, Firestore), REST APIs and the Groq AI API with Provider and Clean Architecture, and ran manual QA on multiple Android versions and physical devices before each release.

SELECTED PROJECTS

MedCare — Healthcare Platform (Flutter + Node.js/TypeScript Backend) FULL-STACK

GitHub: github.com/ahmedmostafa361/medical_app_flutter | October 2026

FLUTTER CLIENT

- Built one Flutter app with two role-based experiences: patients search doctors by name, specialty and clinic, book and reschedule visits in the clinic's time zone, and read records, prescriptions and notifications; doctors run their day from a live dashboard, handle requests, manage hours and time off, and write records and prescriptions.
- Architected the client as MVVM + Clean Architecture (Cubit ViewModels → Use Cases → Repositories → Retrofit/Dio data sources) with GetIt/Injectable DI, with cursor pagination, pull-to-refresh and load-more retry on every list.
- Made every write safe: booking retries reuse one idempotency key so a slow network never creates two appointments, duplicate taps are blocked, 409 slot-taken and invalid-transition errors lead back to fresh data, and nothing shows as saved until the server confirms.
- Implemented the full auth lifecycle: login, registration, 6-digit OTP password reset, session restore, secure token storage, and a Dio interceptor that shares one token refresh across concurrent 401s; 429 responses lock retries for the Retry-After window.
- Rebuilt the UI on a design system (color, type, spacing and shadow tokens, 50+ reusable widgets) with skeleton loading, animations that respect reduce-motion, screen-reader semantics, and full Arabic/English RTL localization, plus a Dart tool that merges translation keys into the ARB files.
- Wrote 170+ automated test files (flutter_test, Mocktail, bloc_test) across mappers, repositories, use cases, ViewModels and screens, plus opt-in integration tests against the production API.

BACKEND

- Built and deployed the Node.js/TypeScript REST backend on PostgreSQL with Prisma for doctors, patients, appointments, medical records, prescriptions and notifications, built in 27 stages each gated by lint, type-checking, tests and a production build.
- Designed one keyset pagination layer for every list endpoint (createdAt with an id tie-breaker, so equal timestamps are never duplicated or skipped; 20 per page by default, 100 max), with HMAC-signed opaque cursors and a response envelope frozen in a written API conventions document; load-tested against 500,000 rows.
- Prevented double-booking with a partial unique index on a doctor's active time slots, and enforced ownership-based access control so each patient and doctor reaches only permitted records.

UNSAID — Anonymous Messaging API (Node.js, Express, MongoDB, Redis) BACKEND

GitHub: github.com/ahmedmostafa361/unSaid-app | October 2026

- Built a 60-endpoint REST API for anonymous messaging with an identity-reveal workflow (request → accept/reject → private two-person conversation), with sender IDs hidden from every query until acceptance.
- Implemented a Redis-based 5-minute account lock after 5 failed logins, email 2-step verification, hashed purpose-bound OTPs, and rotating refresh tokens with per-device sessions and reuse detection.
- Added blocking, reporting, rate limiting, idempotency and caching with Redis, plus validated file uploads; verified with 171 end-to-end checks and documented in Postman.

E-Commerce App — Shopping Application (iOS & Android)

GitHub: github.com/ahmedmostafa361/E_Commerce_app | July 2026

- Built a full e-commerce shopping application with products, categories, brands, wishlist, cart, and persistent login against a live REST API.
- Implemented the UI pixel-for-pixel from Figma and integrated REST with Dio and Retrofit (Bearer/JWT auth, centralized error mapping) on MVVM + Clean Architecture with GetIt/Injectable DI.

Siratic — Prayer Times & Islamic Utility App (iOS & Android) — Live on Google Play

Google Play: play.google.com/store/apps/details?id=com.siratic.quran | May 2026 – Present

- Published on Google Play and maintained across multiple versioned releases, shipping signed AAB builds through the Play Console.
- Designed and shipped a Quran Recitation feature into the live app that tracks the user's reading word by word in real time, with resume, per-verse retry and auto-advance; handled Arabic speech recognition, partial results, word matching and the microphone session lifecycle, with Provider and Selector keeping rebuilds and battery use low.
- Shipped an offline Tafsir Ibn Kathir feature covering all 6,236 Quran verses: compressed an 85 MiB Arabic corpus into a 26 MiB bundled SQLite asset with per-row zlib (3.8x), decompressed lazily so the corpus never loads into memory; the largest record renders in 10 ms. Built the Python pipeline behind it (HuggingFace → Parquet → SQLite) with byte-for-byte round-trip validation against a corpus-wide SHA-256.
- Solved per-ayah tap targeting in a justified RTL page via RenderParagraph.getPositionForOffset.
- Implemented scheduled local Athan notifications (no Firebase or push) and fixed an Android 13 Do Not Disturb bug that suppressed them.

Additional Projects: Stripe Checkout — Flutter Payment Sheet + Node.js payment intents and webhook verification, tested with declined and 3D Secure cards — Flutter_Payment / stripe-payment-service · Restaurant App — food ordering flow on Dio/Retrofit with 30+ test files and GitHub Actions CI (~75% Codecov) — restaurant_flutter_app · Evently — event app with Firebase Auth, Firestore real-time sync, Google Sign-In, OTP recovery, maps and Arabic/English RTL — Eventely_app · Blog API — Node.js/Express, JWT, PostgreSQL/MySQL — blog_app_node_js · Movies App — 4-developer team project (Git PRs) — movies_app · News App — offline-first reader with REST (http), BLoC and Hive caching — news_app · AI To-Do App (Groq API, Speech-to-Text) — to_do_app_flutter · QuizMaster (Firebase, Firestore) — quiz_app_flutter

EDUCATION & CERTIFICATIONS

B.Eng. Computer & Software Engineering — Misr University for Science and Technology | GPA: 3.45 / 4.0 | Expected 2028

Certifications: Flutter Development Diploma — Route IT | SprintUp Mobile (Flutter) — Sprints & Microsoft | Front-End Web Dev — WE | Node.js/Backend Development — In Progress

Technical Content Creator: Flutter tutorials under the brand "Fixha" on YouTube and TikTok (@fixha_tech), 1,000+ followers. **Languages:** Arabic (Native) | English (Professional Working Proficiency)
